

## Unintentional Drug Poisoning (Overdose) Deaths in New York City in 2022

In 2022, 3,026 New Yorkers died of a drug overdose, a 12% increase from 2021 (2,696 deaths), and the highest number since reporting began in 2000. A combination of factors impact overdose risk, including social and structural conditions that affect overall health and well-being; access to quality healthcare, treatment, and services; the type of substances used; and, the setting of use. Mental health is also a driver of overdose risk; more information on the City’s strategies to address New York City’s (NYC) mental health and support people at risk of drug overdose can be found in [Care, Community, Action: A Mental Health Plan for NYC](#).

To support efforts to prevent overdose deaths and ensure the equitable distribution of resources, data including location of overdose and demographics of the decedent are tracked. This report presents provisional data on unintentional drug poisoning deaths in NYC in 2022, also referred to as overdose deaths or overdose mortality.

### Key findings

- In 2022, there were 3,026 overdose deaths in NYC, compared with 2,696 in 2021, an increase of 12% (330 deaths).
- The rate of overdose death increased to 43.3 per 100,000 NYC residents in 2022, from 38.5 per 100,000 in 2021.
- Black New Yorkers had the highest rate of overdose death, and the largest absolute increase in rate from 2021 to 2022 (52.0 to 62.0 per 100,000 residents).
- As in prior years, adults ages 55 to 64 had the highest rate of overdose, followed by adults ages 45 to 54 (in 2022, 78.7 and 65.0 per 100,000 residents, respectively).
- Residents of the Bronx had the highest rate of overdose death in 2022 (73.6 per 100,000 residents), an increase from 2021 (70.1 per 100,000). Staten Island had the second highest rate at 38.0 per 100,000 residents, a steady rate compared with 2021 (37.9 per 100,000).
- Fentanyl was the most common substance involved, present in 81% of overdose deaths in 2022. Cocaine was present in 53% of overdose deaths.
- Approximately seven out of ten overdoses occurred in the decedent’s or someone else’s home.

### Definitions: Unintentional drug poisoning (overdose) deaths

exclude poisonings where the manner of death was classified as intentional (suicide or homicide) or undetermined. They are also referred to as “overdose deaths” or “overdose mortality.”

**Opioids** include substances derived from opium, such as morphine or heroin, and synthetic drugs, such as methadone or fentanyl.

**Opioid analgesics** are commonly known as prescription pain relievers, such as oxycodone (Percocet®) and hydrocodone (Vicodin®). For this analysis, opioid analgesics exclude fentanyl and tramadol.

**Fentanyl** includes fentanyl and fentanyl analogs. Fentanyl analogs, such as beta-hydroxyfentanyl and acetyl fentanyl, are similar in chemical structure to fentanyl. Fentanyl can be one of two types: a synthetic opioid analgesic pharmaceutically manufactured to manage severe pain or non-pharmaceutically manufactured.

**Xylazine** is a non-opioid veterinary sedative/tranquilizer drug.

Substances involved in overdose deaths describe only what has been identified during post-mortem toxicology testing and not how or why these substances were present. Findings are not mutually exclusive; percentages will not sum to 100%.

### In New York City, rates of overdose death are the highest since reporting began in 2000

Number and age-adjusted rate per 100,000 residents of unintentional drug poisoning (overdose) deaths, New York City, 2000 to 2022

Sources: NYC Office of Chief Medical Examiner and NYC DOHMH Bureau of Vital Statistics, 2000–2022; 2021 and 2022 data are provisional and subject to change.

### Overdose death rates are higher for some groups and places

- In 2022, the rate of overdose death among male New Yorkers (70.7 per 100,000 males) was nearly four times as high as the rate among female New Yorkers (18.2 per 100,000 females).
- Rates of overdose death increased for Black, Latino/a, and White New Yorkers in 2022. Black New Yorkers had the highest rate in 2022 (62.0 per 100,000), followed by Latino/a New Yorkers (53.1 per 100,000), and White New Yorkers (36.5 per 100,000).
- The rate among Asian and Pacific Islander New Yorkers decreased from 5.2 per 100,000 in 2021 to 3.4 per 100,000 in 2022.
- Black New Yorkers ages 55 to 84 years had the highest rate of overdose (110.6 per 100,000 residents) compared with Black New Yorkers in other age groups and compared with Latino/a and White New Yorkers of any age.

#### In New York City, rates of overdose death differ by race-ethnicity<sup>^</sup> and age, with Black adults ages 55 to 84 experiencing the highest rates of overdose.

Age-adjusted rate per 100,000 residents of unintentional drug poisoning (overdose) deaths, New York City, 2022

<sup>^</sup>Asian/Pacific Islander, Black, and White race categories exclude Latino/a ethnicity. Latino/a includes Hispanic or Latino/a of any race.

Sources: NYC Office of Chief Medical Examiner and NYC DOHMH Bureau of Vital Statistics, 2022. Data are provisional and subject to change.

- In 2022, Bronx residents had the highest rates of overdose in NYC (73.6 per 100,000).
- From 2021 to 2022, Brooklyn residents experienced the largest increase in the rate of overdose death (from 27.4 per 100,000 to 32.2 per 100,000), followed by residents of Queens (from 20.6 to 24.2 per 100,000), the Bronx (from 70.1 to 73.6 per 100,000), and Manhattan (from 33.4 to 34.4 per 100,000).
- The top five neighborhoods with the highest rates of overdose death were Crotona-Tremont, Hunts Point-Mott Haven, Highbridge-Morrisania, East Harlem, and Fordham-Bronx Park.
- Rates of overdose decreased for Crotona-Tremont (from 109.1 per 100,000 in 2021 to 105.3 per 100,000 in 2022) and Hunts Point-Mott Haven (from 119.6 per 100,000 in 2021 to 100.1 per 100,000 in 2022).

#### Since 2019, the rate of overdose has more than doubled in the Bronx, Brooklyn, and Queens.

Age-adjusted rate per 100,000 residents of unintentional drug poisoning (overdose) deaths, New York City, 2019 to 2022

Sources: NYC Office of Chief Medical Examiner and NYC DOHMH Bureau of Vital Statistics, 2019-2022. 2021 and 2022 data are provisional and subject to change.

#### Definitions

**Race/ethnicity:** For the purpose of this publication, Latino/a includes people of Hispanic origin based on ancestry reported on the death certificate, regardless of reported race; Latino/a excludes reported ancestry from non-Spanish speaking Central/South American countries, and non-Spanish speaking Caribbean islands. Black, White, and Asian/Pacific Islander race categories do not include people of Latino/a origin.

**Neighborhood:** The United Hospital Fund (UHF) classifies New York City into 42 neighborhoods, comprised of contiguous ZIP codes. For more information visit: [www1.nyc.gov/assets/doh/downloads/pdf/ah/zipcodetable.pdf](http://www1.nyc.gov/assets/doh/downloads/pdf/ah/zipcodetable.pdf)

**Neighborhood poverty:** Based on ZIP code and defined as the percentage of residents with incomes below 100% of the federal poverty level (FPL), per American Community Survey 2008–2012, in four groups: low (<10% FPL), medium (10% - <20% FPL), high (20% - <30% FPL), and very high (>=30% FPL).

## High poverty neighborhoods had a larger increase in overdose rates

- The overdose rate among residents of high poverty neighborhoods increased by 21% from 32.4 per 100,000 in 2021 to 39.3 per 100,000 in 2022.
- Overdose rates in low poverty neighborhoods remained stable, with a rate of 21.5 per 100,000 residents in 2021 and 21.8 per 100,000 residents in 2022.
- In 2022, NYC residents of very high poverty neighborhoods had the highest rate of overdose death (72.8 per 100,000 residents) compared with 21.8 per 100,000 residents in low poverty neighborhoods.

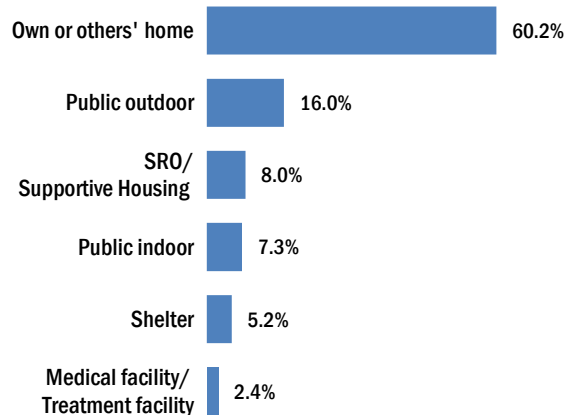

## Opioids, primarily fentanyl, continue to drive overdose deaths

- In 2022, 85% of all overdose deaths involved an opioid; fentanyl was the most common, involved in 81% of overdose deaths.
- The percentage of overdose deaths involving heroin decreased from 53% in 2019 to 32% in 2022.
- Opioid analgesics and methadone each were involved in 12% of overdose deaths.
- In 2022, other substances commonly present in opioid overdose deaths included cocaine (55%), alcohol (44%), and benzodiazepines (15%).
- Opioid-involved overdoses also involving xylazine increased from 19% in 2021 to 22% in 2022.
- Rates of heroin/and or fentanyl-involved overdose more than tripled among Black New Yorkers from 15.7 per 100,000 in 2019 to 50.7 per 100,000 in 2022. In the same period, rates increased from 21.4 to 44.7 per 100,000 and 18.1 to 29.4 per 100,000 among Latino/a and White New Yorkers respectively.

## Most overdoses occurred in indoor settings

- In 2022, the majority of fatal overdoses (60.2%) occurred in a private home.
- There have been notable shifts in settings of overdose over time. From 2019 to 2022, the percentage of overdose deaths that occurred in a decedent's or someone else's home decreased from 66.8% to 60.2%.
- During the same time period, the percentage of overdose deaths that occurred in a public outdoor setting increased from 10.6% to 16.0%.
- The percentage of overdose deaths that occurred in an SRO or supported housing setting also increased from 4.8% in 2019 to 8.0% in 2022.
- Overdose deaths in a shelter remained stable (4.9% in 2019, 5.2% in 2022).

In 2022, about seven out of ten overdoses occurred in a private indoor or SRO/ supportive housing setting.

Public outdoor includes settings such as parks, sidewalks, subway cars, and transit stations. Public indoor includes bars/restaurants/clubs, stores, bodegas/delis, and public bathrooms; other indoor space includes, hotel rooms, building common spaces (stairways, hallways, lobbies, elevators of apartment/restricted buildings). SRO: single-room occupancy

Sources: NYC Office of Chief Medical Examiner and NYC DOHMH Bureau of Vital Statistics, 2022. Data are provisional and subject to change.

**Setting of overdose:** Information provided in scene investigation reports and grouped into categories based on private and public spaces.

**Data Sources** NYC Office of Chief Medical Examiner and NYC DOHMH Bureau of Vital

**Statistics:** Mortality data for 2000–2022 were collected through an in-depth review of data from DOHMH Bureau of Vital Statistics and NYC Office of the Chief Medical Examiner. Data are limited to individuals ages 15 to 84. Data for 2021 and 2022 are provisional and subject to change.

**Rate calculation:** DOHMH population estimates, modified from US Census Bureau intercensal population estimates 2000–2021, updated September 2022. Rates will differ from previously reported rates based on Census counts or previous versions of population estimates. Rates are age-adjusted to Census 2000 US standard population, except those for specific age groups.

**Health equity** is attainment of the highest level of health and well-being for all people. Not all New Yorkers have the same opportunities to live a healthy life. Achieving health equity requires focused and ongoing efforts to address historical and contemporary injustices such as discrimination based on social position (e.g., class, immigration status) or social identities (e.g., race, gender, sexual orientation). For more information, visit the Centers for Disease Control and Prevention's [Health Equity](#) page.

## Implications

Overdose deaths reached unprecedented levels in New York City in 2022. Inequities in overdose death by race/ethnicity, age, income, and neighborhood of residence have widened as the magnitude of the overdose crisis has worsened. Approximately one in 1,000 Black New Yorkers between the ages of 55 and 84 died of a fatal overdose in 2022, a rate that is more than twice the citywide rate. Residents of the South Bronx, East Harlem, and Central Harlem continued to experience the highest rates of fatal overdose in 2022, while Bedford-Stuyvesant and Williamsburg-Bushwick emerged as new areas of concern. Overdose deaths remained highest among residents of very high poverty neighborhoods.

Geographic and racial inequities in the burden of overdose death reflect inequities in income, wealth, employment, education, criminal legal system involvement, and housing. Inequitable access to the resources necessary for health and well-being is a product of structural racism and long-term disinvestment in communities. These data underscore the need for a place-based approach that invests in the communities most impacted by the overdose epidemic.

Fentanyl—a very strong opioid—continues to drive the increase in overdose deaths citywide. For the sixth year in a row, in 2022, fentanyl was the most common substance involved in overdose deaths. In contrast, the proportion of overdose deaths involving heroin decreased from 53% of overdose deaths in 2019 to 32% of overdose deaths in 2022, suggesting a sustained shift away from heroin in the unregulated opioid supply. Drug-checking initiatives—including fentanyl and xylazine test strip distribution and real-time drug-checking services—allow people to test their drugs and take steps to reduce their risk of overdose. Expanding these services is important to address the increased risk of fatal overdose caused by the ongoing presence of fentanyl along with the emerging presence of xylazine in NYC.

New data on the setting of overdose deaths reveal that most overdose deaths occurred in a private home in 2022. Overdoses that occur in these settings are potentially less likely to be witnessed than overdoses in other settings, reducing opportunities for intervention. Further, fear of personal, social, legal, and other consequences can drive people to use drugs in isolation and discourage people from disclosing their substance use to others. Public health interventions which address the stigma and isolation experienced by people who use drugs are needed to support timely overdose responses and reduce the elevated risk of overdose death in private home settings.

While fewer overdose deaths overall occur in public settings, the proportion of overdose deaths that occurred in outdoor public spaces increased in recent years, from 11% in 2019 to 16% in 2022. Public drug use is driven by a lack of alternative places to use drugs and is associated with rushed injections, heightened anxiety, and other factors that increase the risk of overdose. Overdose Prevention Centers (OPC) directly impact public drug use and associated overdose risk by providing hygienic spaces where people can use drugs under the supervision of trained staff and receive critical health and social support services. During the first year of operation, the two OPCs in NYC were used more than 48,000 times by 2,800 people, and staff intervened over 600 times to prevent overdose-related injury and death. Expanding these services to neighborhoods with high rates of overdose is necessary to prevent overdose deaths, especially in public settings.

The Health Department is committed to addressing the key drivers of the overdose epidemic, including the unregulated and volatile drug supply; stigma and isolation faced by people who use drugs; and inadequate access to life-saving services and supports. This requires continued investment in a comprehensive spectrum of prevention, harm reduction, substance use disorder treatment, and recovery services, particularly in communities which continue to bear the greatest burden of overdose death.

\*Data for 2021 and 2022 are provisional and subject to change.

†For the purpose of this publication, Latino/a includes people of Hispanic origin based on ancestry reported on the death certificate, regardless of reported race; Latino/a excludes reported ancestry from non-Spanish speaking Central/South American countries, and non-Spanish speaking Caribbean islands. Black, White and Asian/Pacific Islander race categories do not include people of Latino/a origin.

‡Neighborhood poverty (based on ZIP code) was defined as percent of residents with incomes below 100% of the federal poverty level (FPL) per American Community Survey 2008-2012, in four groups: low (<10%), medium (10% - < 20%), high (20% - < 30%), and very high poverty (>=30%).

\*\*Drug type, not mutually exclusive; percent will not equal 100%. ††For this analysis, opioid analgesics exclude fentanyl and tramadol.

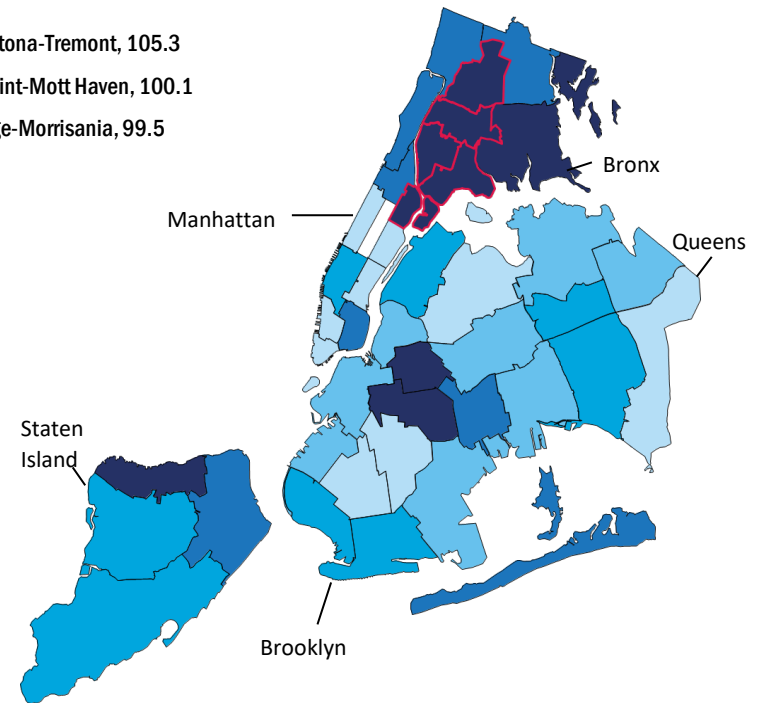

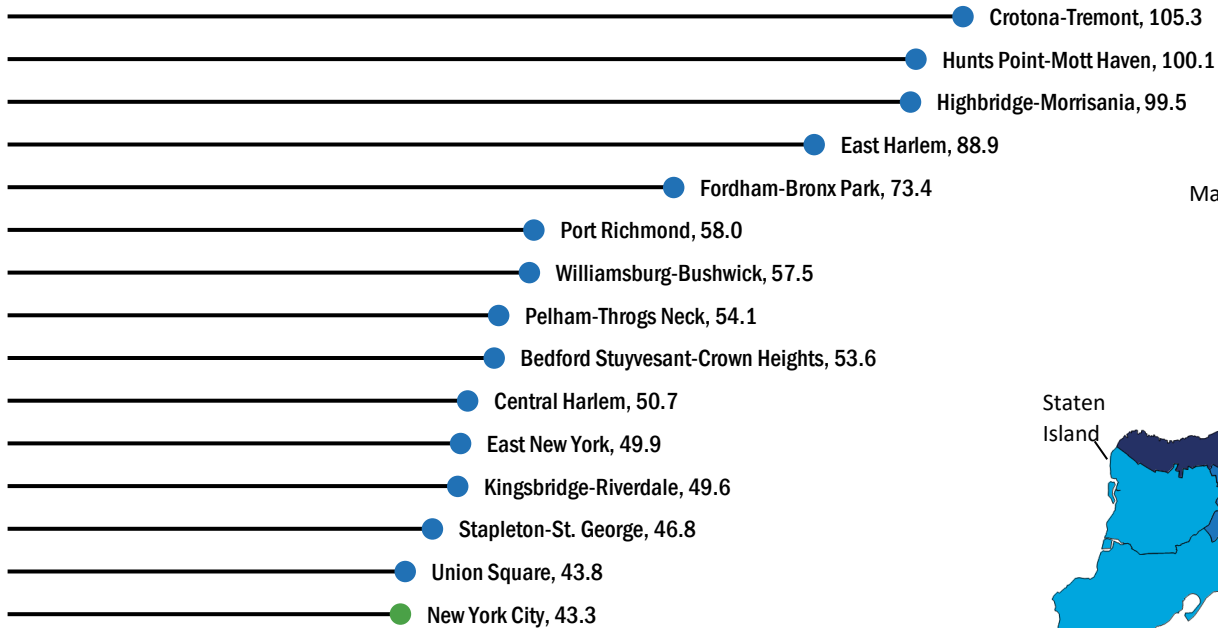

‡‡During 2022, the New York City Office of Chief Medical Examiner began testing of xylazine. Prior to this date, xylazine was not systematically tested therefore findings cannot be compared over time.

^^Top five of 42 NYC Neighborhoods. Neighborhood refers to residence of decedent.

**Map. Highest rates of unintentional drug poisoning (overdose) deaths by neighborhood of residence,<sup>^</sup> New York City, 2022\***

Source: Bureau of Vital Statistics/Office of Chief Medical Examiner, New York City; Rates calculated using NYC DOHMH population estimates, modified from US Census Bureau intercensal population estimates 2000-2021, updated September 2022. Analysis by Health Department's Bureau of Alcohol and Drug Use Prevention, Care and Treatment.

**Neighborhoods with rates of overdose death among residents exceeding the New York City rate, 2022**  
Rate per 100,000 residents are age-adjusted.

\*Data for 2022 are provisional and subject to change.

<sup>^</sup>The United Hospital Fund (UHF) classifies New York City into 42 neighborhoods, comprised of contiguous ZIP codes. Neighborhood refers to residence of decedent.

**Table 2. Number and rate of unintentional drug poisoning (overdose) deaths involving opioids, New York City, 2019-2022\***

Source: Bureau of Vital Statistics/Office of Chief Medical Examiner, New York City; Rates calculated using NYC DOHMH population estimates, modified from US Census Bureau intercensal population estimates 2000-2021, updated September 2022. Analysis by Health Department's Bureau of Alcohol and Drug Use Prevention, Care and Treatment.

Rates per 100,000 New Yorkers are age adjusted, except those for specific age groups.

\*Data for 2021 and 2022 are provisional and subject to change.

†For the purpose of this publication, Latino/a includes people of Hispanic origin based on ancestry reported on the death certificate, regardless of reported race; Latino/a excludes reported ancestry from non-Spanish speaking Central/South American countries, and non-Spanish speaking Caribbean islands. Black, White and Asian/Pacific Islander race categories do not include people of Latino/a origin.

^Neighborhood poverty (based on ZIP code) was defined as percent of residents with incomes below 100% of the federal poverty level (FPL) per American Community Survey 2008-2012, in four groups: low (<10%), medium (10% - < 20%), high (20% - < 30%), and very high poverty (>=30%).

**Table 5. Number and rate of unintentional drug poisoning (overdose) deaths involving opioid analgesics,<sup>††</sup> New York City, 2019-2022\***

Source: Bureau of Vital Statistics/Office of Chief Medical Examiner, New York City; Rates calculated using NYC DOHMH population estimates, modified from US Census Bureau intercensal population estimates 2000-2021, updated September 2022. Analysis by Health Department's Bureau of Alcohol and Drug Use Prevention, Care and Treatment.

Rates per 100,000 New Yorkers are age adjusted, except those for specific age groups.
